Xho I; Filarial nematcde parasite of humans. Two adult—
female worms of Onchocerca volvulus were isolated from
consenting patients and quick frozen. Adult female mRNA
was converted to double-stranded cDNA using reverse
transcriptase and oligo(dT) followed by RNase H and DNA
pol I. The library has 7 x 10E5 independent recombinants
and the average riser size is ~1100bp. The library was
constructed by Michelle Lizotte-Waniewski with worms
provided by Dr. Sara Lustigman. The library is available
from Dr.Steven A. Williams, email: genome@smith.edu."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

/lab host="mixed"
/lab host="xil-blue MRF"
/clon=lib="Zebrafish ICRFzfls"
/clon=strand cDNA was primed with a Not I - oligo(dT)15 primer
[5:padrAGTTCARAGAGGGGGCCCTTTTTTTTTTTTTTTT], on
mRNA from pooled 26 somite zebrafish embryos;
double-stranded cDNA was ligated to Sal I adaptors (BRL),
digested with Not I and cloned into the Not I and Sal I
sites of the pSPOTT vector (BRL). Library was constructed
by Matthew Clark (Lehrach lab; ICRF, London and Max
Planck Institut fuer Molekulare Genetik, Berlin) and was
not biochemically normalised. 70,000 clones from this
library were arrayed on high density filters and
subsequently screened by oligomucleotide hybridization
fingerprinting to identify unique or minimally redundant
clones for more intensive analysis."

double-stranded cDNA was ligated to Sal I adaptors (BRL), digested with Not I and cloned into the Not I and Sal I sites of the DSPORTI vector (BRL). Library was constructed by Matthew clark (Lahrach lab; ICRF, London and Max Planck Institut fuer Molekulare Genetik, Berlin). cDNAs for EST analysis were selected following obligonucleotide hybridization fingerprinting of arrayed clones from zebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data ware used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Actinopterygii; Neopterygii; Teleostei; Ostariophysi; Cypriniformes; Cyprinidae; Danio.

Novel isolated 16S rDNA Helicobacter polynucleotides useful as probes or primers for detecting and/or typing Helicobacter strains present in a biological sample.

Claim 2; Page 24-25; 132pp; English.

This sequence represents a Helicobacter 16SrRNA sequence of the invention. A probe which specifically hybridises to the 16SrRNA sequence and a primer which specifically maplifies it are used for detecting and/or typing Helicobacter strains present in a biological sample (obtained from mammals preferably oattle and pigs) by hybridishig or specifically amplifying the 16S rRNA gene target region of Helicobacter strains present in the biological sample with the primer or probe, respectively. The 16S rRNA sequence is also used as a medicament. The 16S rRNA sequences are used for studying and detecting pathogenic Helicobacter strains which cause gastric ulcers and chronic gastritis in

invention. A probe which specifically hybridises to the 16SzRNA sequence and a primer which specifically maplifies it are used for detecting and/or typing Helicobacter strains present in a blological sample (obtained from mammals preferably cattle and pigs) by hybridising or specifically amplifying the 16S rRNA gene target region of Helicobacter strains present in the biological sample with the primer or probe, respectively. The 16S rRNA sequence is also used as a medicament. The 16S rRNA sequences are used for studying and detecting pathogenic Helicobacter strains which cause gastric ulcers and chronic gastritis in mammals, particularly cattle and pigs. The method is also useful for detection of zoonoses in humans. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                            ö

```
This sequence represents a Helicobacter 16SrRNA sequence of the invention. A probe which specifically hybridises to the 16SrRNA sequence and a primer which specifically maplifies it are used for detecting and/or typing Helicobacter strains present in a biological sample (obtained from mammals preferably cattle and pigs) by hybridising or specifically amplifying the 16S rRNA gene target region of Helicobacter strains present in the biological sample with the primer or probe respectively. The 16S rRNA sequence is also used as a medicament. The 16S rRNA sequence is also used as a medicament. The 16S rRNA sequence is also used as an edicament. The 16S rRNA sequence is also used as an edicament, the 16S rRNA sequence is also used as an edicament, or an endicament, and obtains and chronic gastricis in mammals, particularly cattle and pigs. The method is also useful for detection of zonoses in humans. (Updated on 15-SEP-2003 to standardise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated 16S rDNA Helicobacter polynucleotides useful as probes or primers for detecting and/or typing Helicobacter strains present in a biological sample.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                introduction. A probe which specifically hybridises to the 16SrRNA sequence and a primer which specifically amplifies it are used for detecting and a primer which specifically amplifies it are used for detecting and/or typing Helicobacter strains present in a biological sample (obtained from mammals preferably cattle and pigs) by hybridising or specifically amplifying the 16S rRNA gene target region of Helicobacter strains present in the biological sample with the primer or probe, respectively. The 16S rRNA sequence is also used as a medicament. The 16S rRNA sequences are used for studying and detecting pathogenic ranns which cause gastric ulcars and chronic gastritis in mammals, particularly cattle and pigs. The method is also useful for detection of zoonoses in humans. (Updated on 15-SBP-2003 to standardise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated 16S rDNA Helicobacter polynucleotides useful as probes or primers for detecting and/or typing Helicobacter strains present in a biological sample.
                                       Helicobacter; 16SrRNA; detection; strain identification; gastric ulcer;

                                                                                                                                                                                                                                                                           ö
                                 This sequence represents a Helicobacter 16SrRNA sequence of the invention. A probe which specifically hybridises to the 16SrRNA sequence and a primer which specifically amplifies it are used for detecting and/or typing Helicobacter strains present in a biological sample (obtained from mammals preferably cattle and pigs) by hybridising or specifically amplifying the 16S rRNA gene target region of Helicobacter strains present in the biological sample with the primer or probe respectively. The 16S rRNA sequence is also used as a medicament. The 16S rRNA sequence is also used as a medicament. The 16S Helicobacter strains which cause gastric ulcers and chronic gastritis in mammals, particularly cattle and pigs. The method is also useful for detection of zoonoses in humans. (Updated on 15-SEP-2003 to standardise

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a gene coding Chlamydia 16s ribosome RNA from Chlamydia pecorum. Also described in the present invention are: (1) a recombinant vector containing the above gene; and (2) a transformant transformed by the above recombinant vector. The nucleic acid, and primers which can hybridise to it, are used for the specific nucleic acid amplification detection of a Chlamydia genus microbe i.e. detection of PCR products. (Updated on 17-OCT-2003 to standardise OS field)
Helicobacter strains which cause gastric ulcers and chronic gastritis in mammals, particularly cattle and pigs. The method is also useful for detection of zoonoses in humans. (Updated on 15-SBP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                - used for

                                                                                                                                                                                                                                                                                                                                                                                                     ·;
                                                                                                                                       The present sequence represents a gene coding Chlamydia 16s ribosome RNA from Chlamydia psittaci. Also described in the present invention are: (1) a recombinant vector containing the above gene; and (2) a transformant transformed by the above recombinant vector. The nucleic acid, and primers which can hybridise to it, are used for the specific nucleic acid amplification detection of a Chlamydia genus microbe i.e. detection of PCR products. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a gene coding Chlamydia 16s ribosome RNA from Chlamydia psittaci. Also described in the present invention are: (1) a recombinant vector containing the above gene; and (2) a transformant transformed by the above recombinant vector. The nucleic acid, and primers which can hybridise to it, are used for the specific nucleic acid amplification detection of a Chlamydia genus microbe i.e. detection of PCR products. (Updated on 17-OCT-2003 to standardise OS field)
                                    Chlamydia species ribosome genes, and primers derived from it - used for the nucleic acid amplification detection of Chlamydia species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            - used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chlamydia genus; microbe; bird-hosted; 16S ribosome RNA; detection; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a gene coding Chlamydia 16s ribosome RNA from Chlamydia psittaci. Also described in the present invention are: (1) a recombinant vector containing the above gene, and (2) a transformant transformed by the above recombinant vector. The nucleic acid, and primers which can hybridise to it, are used for the specific nucleic acid amplification detection of a Chlamydia genus microbe i.e. detection of PCR products. The present sequence represents a gene coding Chlamydia 16s ribosome RNA a from Chlamydia psittaci. Also described in the present invention are: (1) a recombinant vector containing the above gene; and (2) a transformant transformed by the above recombinant vector. The nucleic acid, and primers which can hybridise to it, are used for the specific nucleic acid amplification detection of a Chlamydia genus microbe i.e. detection of PCR products. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense, bacterial 16s ribosomal RNA, rRNA, bacterial infection, human, food grain supplement, livestock; poultry, therapeutic, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antibacterial compound, useful for treating bacterial infections and as livestock and poultry food supplement, comprises antisense oligonucleotides complementary to bacterial 16S and 23S rRNA.
                                                                                                                                                                                                     Chlamydia species ribosome genes, and primers derived from it
the nucleic acid amplification detection of Chlamydia species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 20; DB 2; Length 1548; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a gene coding Chlamydia 16s ribosome RNA from Chlamydia trachomatis. Also described in the present invention are:
(1) a recombinant vector containing the above gene; and (2) a transformed by the above recombinant vector. The nucleic acid, and primers which can hybridise to it, are used for the specific nucleic acid amplification detection of a Chlamydia genus microbe i.e. detection of PCR products

bacterial compounds comprising substantially uncharged antisense cligomers containing 8-40 nucleotide subunits, including a targeting nucleic acid sequence at least 10 nucleotides in length which is complementary to a bacterial 165 or 235 rRNA nucleic acid sequence. The antisense oligomers are used for treating a bacterial infection in a human or a mammalian singly produced by Escherichia coil, Salmonella typhimurium, Pseudomonas aeruginosa, Vibrio cholera, Neisseria gonorrhoea, Helicobacter pylori, Bartonella henselae, Haemophilus influenza, Shigalla dysenterae, Staphylococcus aureus, Mycobacterium tuberculosis, Streptococcus pneumoniae, Treponema palladium and Chamydia trachomatis. The antibacterial compound may be used as a food grain supplement in livestock and poultry food composition. Note: The present sequence is not shown in the specification but has been accessed from GenBank using the appropriate accession number given in the specification. (Updated on 06-NUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a gene coding Chlamydia 16s ribosome RNA from Chlamydia trachomatis. Also described in the present invention are: (1) a recombinant vector containing the above gene; and (2) a transformant transformed by the above recombinant vector. The nucleic acid, and primers which can hybridise to it, are used for the specific nucleic acid amplification detection of a Chlamydia genus microbe i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chlamydia species ribosome genes, and primers derived from it - used for the nucleic acid amplification detection of Chlamydia species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chlamydia genus; microbe; bird-hosted; 16S ribosome RNA; detection; ds.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
